Re Item V

The following document is referred to in this opinion:

D1: WO 99/31808.

The application relates to a data rate matching apparatus and method having a data shift register adapted to receive a continuous stream of data.

Such an apparatus/method is disclosed in document **D1** (see for example page 12, lines 26-31).

In order to reduce the implementational complexity of this known apparatus/method, a validity shift register is provided; a control unit controls whether or not a data item in the data shift register is to be output using information from the validity shift register; information in both the data and the validity shift register is shifted at a specified clock rate.

This combination of features is neither disclosed nor rendered obvious by the available prior art.

The dependent claims add further features to the subject-matter of the independent claims, and therefore their subject-matter is also considered new and inventive.
